

Assignments

Python assignment - 1

Date	23 September 2022
Student Name	Gowtham E
Project Name	Project -Skill and Job recommender application
Maximum Marks	2 Marks

String Operations

Question:

Write a program to concatenate, reverse and slice a string?

Solution :

```
#!/usr/bin/env python3
```

```
# -*- coding: utf-8 -*-
```

```
"""
```

```
Created on Wed Sep 21 08:10:03 2022

```

```
"""
```

```
#Program for String concatenation
```

```
str1 = input("Enter the first string: ")
```

```
str2 = input("Enter the second strng: ")
```

```
new_str = str1 + str2
```

```
print("Concatenated string is :",new_str) #Prints the result of concatenation
```

```
#Code for String Slicing
```

```
length = len(new_str)
```

```
slicey = int(input("Enter the number of charaacters to be sliced :"))
```

```
if(length<slicey):
```

```
    print("Length is exceeded")
```

```
else:
```

```
    new_str = new_str[0:slicey]
```

```
    print("Sliced string is :",new_str) #Result for slicing
```

```
#Code for Strig reverse
```

```
print("Reversed string is : ",new_str[::-1]) #Result for String reverse
```

```
1
2 #Program for String concatenation
3 str1 = input("Enter the first string: ")
4 str2 = input("Enter the second string: ")
5 new_str = str1 + str2
6
7 print("Concatenated string is :",new_str) #Prints the result of concatenation
8
9 #Code for String Slicing
10 length = len(new_str)
11
12 slicey = int(input("Enter the number of characters to be sliced :"))
13 if(length<slicey):
14     print("Length is exceeded")
15 else:
16     new_str = new_str[0:slicey]
17     print("Sliced string is :",new_str) #Result for slicing
18
19 #Code for String reverse
20
21 print("Reversed string is : ",new_str[::-1]) #Result for String reverse
22
23
24
25
```

```
Enter the first string: Hi
Enter the second string: Gowtham
Concatenated string is : HiGowtham
Enter the number of characters to be sliced :5
Sliced string is : HiGow
Reversed string is : woGtHi
```

Basic Calculator

Question:

Write a Calculator program in Python?

Solution:

```
#!/usr/bin/env python3
# -*- coding: utf-8 -*-
"""

Calculator program in python

#Calculator function
def calculate(a, b, c):

```
    if(c == '+'):
        return a+b
    elif(c == '-'):
        return a-b
    elif(c == '*'):
        return a*b
    elif(c == '/'):
        return a//b
    else:
        return null
```

#Main program

```
first = int(input("Enter first number : ")) #Getting first number
second = int(input("Enter second number : ")) #Getting second number
```

```
operator = input("Enter the operation : ")[0]
```

```
print("Your result is " , calculate(first,second,operator))
```

```
1  #!/usr/bin/env python3
2  # -*- coding: utf-8 -*-
3  """

27
28 operator = input("Enter the operation : ")[0]
29
30 print("Your result is " , calculate(first,second,operator))
31
32
```

```
Enter first number : 45
Enter second number : 4
Enter the operation : *
Your result is 180
```

List operations

Questions:

Consider a list (list = []). You can perform the following commands

insert i e: Insert integer at position .

print: Print the list.

remove e: Delete the first occurrence of integer .

append e: Insert integer at the end of the list.

sort: Sort the list.

pop: Pop the last element from the list.

reverse: Reverse the list.

Initialize your list and read in the value of followed by lines of commands where each command will be of the types listed above. Iterate through each command in order and perform the corresponding operation on your list.

Solution:

```
#!/usr/bin/env python3
# -*- coding: utf-8 -*-
"""
```

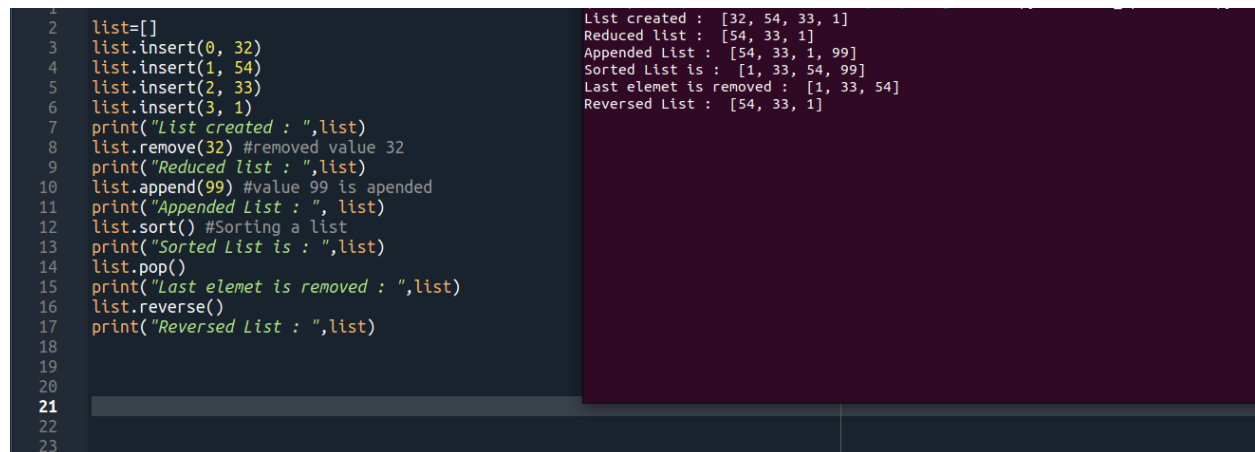

Created on Fri Sep 23 12:07:06 2022

```
@author: gowtham
"""
```

```

list=[]
list.insert(0, 32)
list.insert(1, 54)
list.insert(2, 33)
list.insert(3, 1)
print("List created : ",list)
list.remove(32) #removed value 32
print("Reduced list : ",list)
list.append(99) #value 99 is apended
print("Appended List : ", list)
list.sort() #Sorting a list
print("Sorted List is : ",list)
list.pop()
print("Last elemet is removed : ",list)
list.reverse()
print("Reversed List : ",list)

```

The screenshot shows a Python script being executed in a terminal. The script performs several list operations: creating a list, inserting elements at specific indices, removing an element, appending a new element, sorting the list, removing the last element, and reversing the list. The output of each operation is printed to the console.

```

1  list=[]
2  list.insert(0, 32)
3  list.insert(1, 54)
4  list.insert(2, 33)
5  list.insert(3, 1)
6  print("List created : ",list)
7  list.remove(32) #removed value 32
8  print("Reduced list : ",list)
9  list.append(99) #value 99 is apended
10 print("Appended List : ", list)
11 list.sort() #Sorting a list
12 print("Sorted List is : ",list)
13 list.pop()
14 print("Last elemet is removed : ",list)
15 list.reverse()
16 print("Reversed List : ",list)
17
18
19
20
21
22
23

```

Output:

```

List created : [32, 54, 33, 1]
Reduced list : [54, 33, 1]
Appended List : [54, 33, 1, 99]
Sorted List is : [1, 33, 54, 99]
Last elemet is removed : [1, 33, 54]
Reversed List : [54, 33, 1]

```

Why is Python a popular programming language?

Python is a general-purpose language that is easy to learn and use. Due to its popularity, there is a big and helpful community. Also, Python is backed up by big companies like Google, Amazon, and Facebook. Python is suggested as the first programming language to learn due to its English-like syntax.

What are the other Frameworks that can be used with python?

- Bottle
- Flask
- Django
- Web2py
- AIOHTTP
- CherryPy
- Dash
- Falcon

Full form of WSGI?

The Web Server Gateway Interface (WSGI, pronounced whiskey or WIZ-ghee) is a simple calling convention for web servers to forward requests to web applications or frameworks written in the Python programming language.
